
Quarterly Revenue Analysis

This notebook compares 2026 revenue with 2025 and fits a simple growth model

$$R_q = R_0 (1 + g)^q$$

where g is the quarterly growth rate.

```
import pandas as pd
revenue = pd.DataFrame({'2026': [1.42, 1.58, 1.71, 1.96], '2025': [1.21, 1.30, 1.44, 1.52]},
index=['Q1', 'Q2', 'Q3', 'Q4'])
revenue
```

	2026	2025
Q1	1.42	1.21
Q2	1.58	1.30
Q3	1.71	1.44
Q4	1.96	1.52

1 Growth

The chart shows both years side by side.

```
revenue.plot.bar()
```

```
from sympy import symbols, Eq
R0, g, q = symbols('R_0 g q')
Eq(symbols('R_q'), R0*(1+g)**q)
```

$$R_q = R_0 (1 + g)^q$$

```
growth = (revenue['2026'] / revenue['2025'] - 1).mean()
print(f'Average growth: {growth:.1%}')
```

Average growth: 20.6%

```
revenue['2027']
```

KeyError: '2027'
