
Spring Field Survey 2026

Soil moisture, crop emergence and recommendations for the Zemgale fields

Results of the spring soil and crop survey.

1 Summary

The spring survey covered **42 fields** across three farms. Emergence was 6% faster than in 2025, and soil moisture stayed within the optimal band on most fields.¹

2 Method

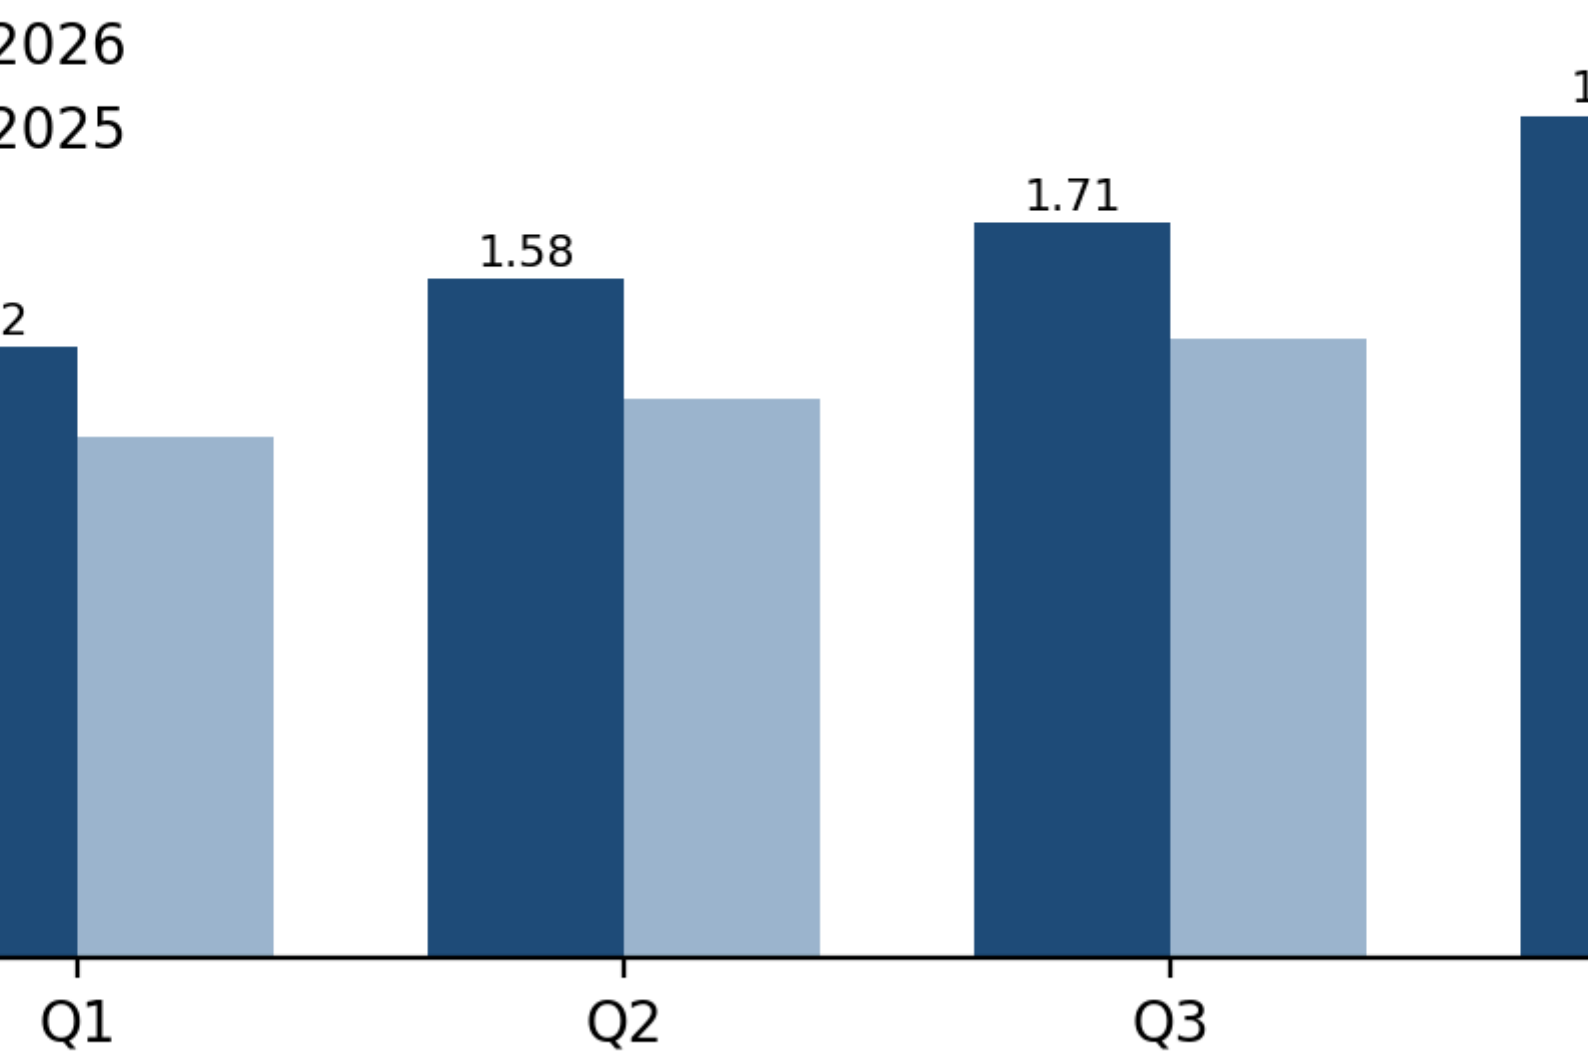

- 1. Sampled moisture at 10 cm and 30 cm depth.
- 2. Counted emerged plants in five 1 m² frames per field.
- 3. Compared with the 2025 baseline.

3 Results

Table 1: Average values per farm

Farm	Fields	Moisture (%)	Plants per m ²
Ozolkalni	18	24.1	312
Bērzciems	14	21.7	298
Lejas	10	26.3	305

Revenue for the season is projected as shown below.

4 Recommendations

- Delay nitrogen application on Lejas by one week.
- Repeat the moisture survey after the first heavy rain.

| Good soil structure is worth more than any single input.
