

Field Guide to Soil Sampling

Soil sampling is the foundation of any nutrient management plan. A representative sample must combine material from many points across the field, taken at a consistent depth and handled carefully to avoid contamination.

Equipment

- Stainless steel probe or auger
- Clean plastic bucket
- Sample bags and a permanent marker

Procedure

- 1 Divide the field into uniform zones.
- 2 Collect fifteen to twenty cores per zone.
- 3 Mix the cores thoroughly and fill one bag per zone.

Label each bag with the field name, the zone and the date. **Ship samples within two days** and keep them *cool and dry* in the meantime.

Depth Crop Interval

0–15 cm

Cereals

Every 3 years

0–30 cm

Grassland

Every 4 years

Latviešu teksts: ģimenes saimniecības, ķīmiskās analīzes, ļoti svarīgi, ņemot vērā augsnes īpašības.
